Hangman with Emojis

10-Week Project Plan

Project Overview

Project Name: Hangman with Emojis

Technology: Java (Swing GUI)

Duration: 10 weeks

Objective: The purpose of this project is to create a visually engaging, emoji-enhanced Hangman game with multiple word categories and a colorful interface.

Project Diagram:

10-Week Plan Overview

Week	Phase	Description
01	Project setup & planning	Environment setup, requirements, UI mockups
02	Data & word list design	Create emoji-word pairs for all levels
03	Core game logic (CLI)	Basic game mechanics in terminal
04	Scoring & lives system	Points, lives, level progression
05	Hint system & difficulty	Hints, adaptive difficulty
06	GUI with Tkinter or Pygame	Main interface, panels
07	Visual feedback & UX	Animations, colors, feedback
08	Leaderboard & save system	Score storage, ranking
09	Testing & bug fixing	Quality assurance
10	Packaging & launch	Final build, documentation

Week 1: Project setup & planning

Objectives

- Set up Python project structure and virtual environment
- Initialize Git repository with .gitignore
- Write a Game Design Document (GDD) — rules, word categories, scoring
- Brainstorm 50+ emoji-to-word puzzles manually
- Install pygame/tkinter early and verify it opens a blank window

Task Breakdown

- **Project structure & virtual environment** — Create folders, set up a venv, add a requirements.txt, and confirm Python runs inside it.
- **Git repository** — Run git init, add a .gitignore, make an initial commit, and push to GitHub.
- **Design doc** — Define wrong-guess limit, categories, difficulty tiers, and a scoring outline in DESIGN.md.
- **Emoji-to-word mapping** — Decide one-emoji vs emoji-set per word, test a few samples, and document the format.
- **Word list** — Brainstorm 50+ words, tag each with difficulty, and assign an emoji to each.

Deliverables

- Game Design Document
- project repository
- 50 emoji puzzles
- pygame/tkinter installed

Tools & Resources

- Python 3.11+
- venv
- Git.
- GitHub
- VS Code/pycharm
- Markdown
