

Week 4: Scoring & Lives System

Objectives

- Add a lives/wrong-guess limit
- Implement scoring with streak bonuses
- Track progression across puzzles

Task Breakdown

- Set max wrong guesses, deduct a life per wrong guess
- Award points per correct guess + streak bonus
- End game when lives hit 0
- Increase difficulty as score grows
- Integrate into Week 3's game loop

Deliverables

- CLI game with working lives + score system
- `score_manager.py`
- Short demo showing score/lives updating

Tools & Resources

- Python 3.11+
- VS Code/PyCharm
- Git

CLI game with working lives & score system

The image shows a screenshot of a Visual Studio Code editor window. The editor is open to a file named `hangman.py`. The code in the editor is a Python script for a Hangman game. The game interface is displayed in the terminal output, showing a welcome message, game rules, and the start of the Easy level. The game state shows 5 lives left, a score of 0/10, and a word with 7 letters. The prompt asks the user to guess a letter.

```
=====
WELCOME TO HANGMAN WITH EMOJIS
=====

GAME RULES
♥ You have 5 wrong guesses in total.
● Easy Level = 5 words
● Medium Level = 3 words
● Hard Level = 2 words
★ 10 points = WINNER
=====

● EASY LEVEL STARTED!

=====
Difficulty: Easy
Emoji Hint: 🍌 🍌 🍌 🍌 🍌
The word has 7 letters.
=====

Word: _ _ _ _ _
♥ Lives left: 5
★ Score: 0/10
Guess a letter:
```

VS Code interface details: The top bar shows 'Ex1' and 'Version control'. The file explorer on the left shows `hangman.py`, `game_logic.py`, and `score_manager.py`. The Run and Debug sidebar is on the right. The status bar at the bottom shows 'Ex1 > hangman.py', '129:31', 'CRLF', 'UTF-8', '4 spaces', 'Python 3.13 (Ex1)', and a system tray with weather and date information.
